

# 5

# FALL opportunities to take advantage of **NOW**

## 1 AERIFICATION

APEX-10 applications before & after aeration will maximize root development - increasing density and mass. Also, APEX-10 will give native soil microbes a boost.

## 2 OVERSEEDING

Apply APEX-10 just after your overseeding or hydroseeding project & you'll increase nutrient availability for new seedlings as soon as that shell cracks resulting in improved germination.

## 3 PLANTING

Reduce the chance of loss by more than 50% just by adding 2oz per tree & 1oz per shrub per 5 gallons of water, soaking the root ball & the hole it is going in.

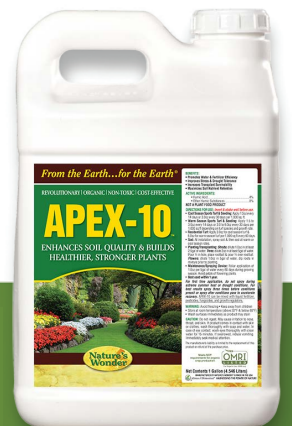

## 4 SODDING

When repairing areas of sod, increase transplant survival rate by applying APEX-10 to the soil and then again on top of the new sod. This will help increase the sod's rooting and increase density of the new turf.

## 5 WINTER PREP

Better prepare your plants & turf for the coming winter with fall applications of APEX-10 to build up carbohydrate reserves. It's these reserves that help fight winterkill and lead to an accelerated spring wake-up.
